TITLE:

Atom Coordinates of a Complex Structure by Direct Determina-

PERIODICAL:

K'o Hsueh T'ung Pao, 1959, Nr 22, pp 759-760

ABSTRACT:

System of equation:

 $|F(hkl)|^2 = \sum_{n,m=1}^{N} f_n \cdot f_m \exp\{2\pi i [h(x_n - x_m) +$

 $+k(y_n - y_m) + 1(z_n - z_m)$

(1)

Card 1/4

 $(\mathbf{x}_n-\mathbf{x}_m)$, $(\mathbf{y}_n-\mathbf{y}_m)$, and $(\mathbf{z}_n-\mathbf{z}_m)$ can be solved, and atom coordinates can be determined.

APPROVED FOR RELEASE: 09/19/2001

1016

Atom Coordinates of a Complex Structure by Direct Determination (Cont.) C/031/59/000/22/008/026
F029/F001

General method for solving eq. (1) is worked out by Ott and Avrami. let: $f_n = Z_n \hat{f}$

Zn - atomic no. of nth atom

f -- unit scattering amplitude of atom

thus results in:

 $\frac{F(hkl)}{\hat{\mathbf{f}}} = \sum_{n=1}^{N} Z_{n} \exp \left[2\pi i (hx_{n} + ky_{n} + lz_{n}) \right]$ (2)

Usually, difficulties are encountered in solving these equations. In determining the left hand side of eq. (2), all factors affecting the radiation strength must be used, but some of them cannot be determined correctly. Besides, the symbols and circular phase (with respect to structures without center of symmetry) are unknown.

Card 2/4

If |F| = 0

(3)

Atom Coordinates of a Complex Structure by Direct Determination (Cont.) C/031/59/000/22/008/026

F029/F001

The value of $\Lambda \cdot F^2$ (A is the product for all strength factors) will be determined by experimental results. If A is not equal to zero, then $AF^2 = 0 \text{ and } F^2 = 0 \tag{4}$

Under general condition:

$$F^2 = F \cdot F^* = (a + ib)(a - ib)$$

hence

$$a + ib = a - ib = 0$$

$$a = b = 0$$
(5)

Both the structural amplitude symbol and the circular phase are not included in equation (3). The structure amplitude in equation (3) includes atom scattering factor and the thermal factor. Atom scattering factors can be found in a handbook, or by utilizing the unit scattering factor for an atom given by Ott and Avrami. Thus:

Card 3/4

APPROVED FOR RELEASE: 09/19/2001

CIA-RDP86-00513R001962320002-6"

Atom Coordinates of a Complex Structure by Direct Determination (Cont.) C/031/59/000/22/008/026 F029/F001

$$\frac{F(nkl)}{\hat{f}} = \sum_{n=1}^{N} Z_{n} \exp \left[2\pi i (hx_{n} + ky_{n} + 1z_{n}) \right] = 0 \quad (6)$$
thermal factor being
$$\exp \left[-B_{n} (\frac{\sin \theta}{\Lambda})^{2} \right]$$

The thermal factor being

is generally substituted by

 $\exp\left[-\mathbb{E}(-\frac{\sin\theta}{2})^2\right]$

Equation (6) is better than equation (2) for the following reasons:

1. Equation (6) will be used to determine the atom coordinates for any complex single cell crystal having any number of atoms, if and only if the number of independent variables (x, y, z) are not more than the number of equations derived from equation (6).

2. This is applicable to both the symmetrical and the nonsymmetrical centered crystals.

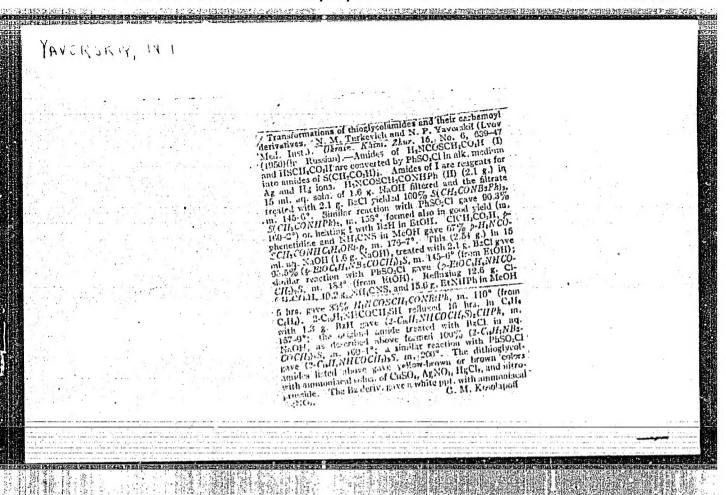

3. Accurate computations for strength factors are not necessary.

4. The degree of equation (6) is determined by the indices hkl, while the degree for equation (2) is determined by N, the number of atoms in the single cell. There are six references.

Title : A New Color Reaction of Antipyrine

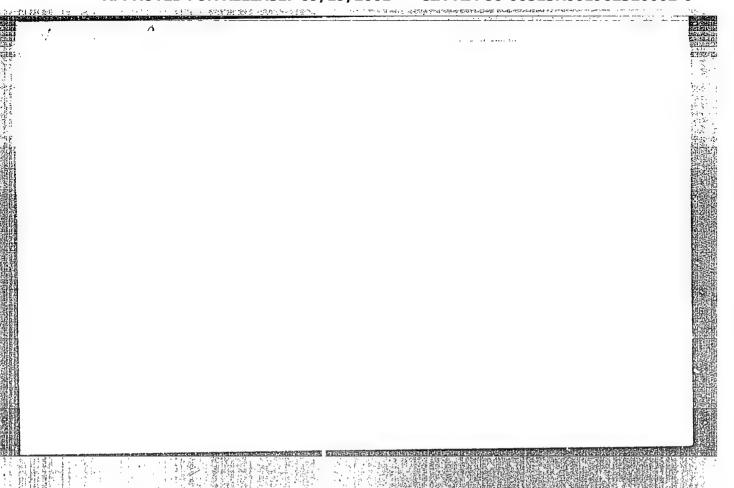

Orig Pub : Aptech. delo, 1956, Vol 5, No 4, 40-41.

Abstract: For the identification of antipyrine, 0.5 ml of a 5% alcoholic

solution of xanthydrol is added to a 1-2 mg sample of the test substance in a test tuoe, and the mixture is heated until solution is complete; 1-2 drops of HCl are added, the mixture is heated to boiling, and the appearance of a stable violet-reddish color is observed. A similar color reaction is obtained when 1-2 drops of H₂SO₄, HNO₃, 25% phosphoric acid, or 1 ml glacial CH COOH are added in the place of HCl. The method makes possible the detection of 35 of antipyrine in 1 ml solution. The presence of pyramidon, phenacetine, aspirin, caffeine, luminal, and codeine does not interfere with the determination. When antipyrine is determined in mixtures, conc. HCl is used to acidify the solution.

75-13-2-20/27 AUTHOR: Yavorskiy, N. P. Color-Reactions of Phenols With Xanthydrol (Tsvetnyye TTTLE: reaktsii fenolov s ksantgidrolom) Zhurnal Analiticheskoy Khimii, 1958, Vol. 13, Nr 2 PERIODICAL: pp. 255-256 (USSR) Xanthydrol is usually used as reagent on amides, urethunes ABSTRACT: and derivatives of barbituric acid (Reference 1). The reagent xanthyl forms compounds with these compounds which can easely be purified and which have marked melting points. Kanthydrol can react also with mono-and diphenol (references 2,3) in which case colorless crystalline products of condensation are formed. This latter reaction is of no analytical importance because it takes place only very slowly and since it produces only very small yields which are difficult to be isolated and purified. The authors found that xanthydrol can react in alcoholic solution in the presence of mineral acids with phenolone by forming colored products of reaction. This color- reaction of the phenols with xanthydrol is more specific than the known color-reaction Card 1/3

Color-Reactions of Phenols With Manthydrol

75-13-2-20/27

with ferric chloride. Many phenol derivates which produce colored reaction products with forric chloride, do not react with xanthydrol. The reagent was produced by the author by reduction of pure xanthone with sodium amalgam (Reference 4). The alcoholic solution of the reagent can be used also after 6 months. In order to carry out the proof- reaction on phenols, 2 to 3 mg of the sample are slightly heated with 0,5 ml of a 5% alcoholic solution of xanthydrol in order to dissolve phenol. Subsequently, some drops of hydrochloric acid are added and the mixture is boiled for some seconds; in which case an intense coloring takes place. A yellow coloring - which disappears however after the cocling down - takes place on the heating of a solution of xanthydrol with some hydrochloric acid. The coloration which takes place with heating of phenols with xanthydrol and hydrochloric acid, is - on the contrary very stable. A decolorization does not take place, even after some days. The sensitiveness of the reaction increases intensely according to the decreasing pH- value of the mixture of

Card 2/3

reaction. A positive reaction with xanthydrol is produced

Yavorskiy, P.

TITLE:

Exposition of Czechoslovakian instruments and apparatus used

in nuclear engineering

PERIODICAL: Atomnaya energiya, v. 11, no. 5, 1961, 465 - 467

TEXT: A brief account is given of a Czechoslovakian exposition held in June 1961 in Moscow at the Politekhnicheskiy muzey (Polytechnic Museum). The instruments and devices shown there may be divided into two groups: electronic devices and devices for use in laboratories where radioactive material is handled. The following devices are described in brief: automatic apparatus for measuring radioactive samples of the type NZQ-615, equipped with scintillation or Geiger counters, which is used for quick and accurate measurement of great numbers of hot samples; NaI(T1), ZnS, plastics and liquid scintillators for gamma and particle counting; NaI(T1) scintillators were produced with diameters of 140 mm, a size which ensures high resolution; universal electrometer of the type "Univel" for measuring

Card 1/3

Exposition of Czechoslovakian...

S/089/61/011/005/014/017 B102/B104

electric charges, voltages or very low currents. It is designed as a dynamic instrument with a vibration membrane capacitor and can only be used in conjunction with an ionization chamber; several pocket dosimeters for radiation dose and intensity measurements; "soil-meter" of the type Sb 725 - Sb 500 for continuous measurement of the soil content in pulp pipes or for flow-rate control of other substances in pipelines. It is equipped with a Co 60 gamma source, an ionization chamber, and a dynamic electrometer; radiometrical instruments for geological prospecting, analysis and ore dressing, e.g., the gamma radiometer RSR-0.4 for sorting active material on a conveyer belt, or the gamma radiometer RAR-0.4 for quick analysis. Other types are KPR-0.2, RKS-0.5, PPR-0.1 (β,γ) , and SMZ-0.1 (a). An irradiation apparatus, "Cesioterax", for clinic therapy with Cs 137 of 200-curie_activity. The surface dose rate does not_exceed 8 mr/hr. "Khizotron" [Abstracter's note: Exact spelling unknown], a gamma irradiator for therapeutic purposes, with a Co⁶⁰ source of 1000 r/hr. "Betatron" is the name of an irradiator combined with an accelerator for industrial defectoscopic examinations; the particle energy can be varied between 3 and 15 Mev. Also a remote control desk (L2 101) was shown, which Card 2/3

Yavorskiy, V. I.

TITLE:

The Stromatoporoidea of the Soviet Union (Stromatoporoi-

dea Sovetskogo Soyuza)

PERIODICAL:

Tr. Vses. n-i, geol. in-ta, 1955, Mr 8, 173 pp

ABSTRACT:

The author describes 195 species: 12 from the ordovician (8 of them new), 60 from the Upper Silurian (44 new), 18 from the Lower Devonian (16 new), 88 from the Middle Devonian (68 new), 14 from the Upper Devonian (12 new), 2 from the Lower Carboniferous (both new), and I from the Upper Jurassic. The method of studying them is described. The forms are characterized by coenostea, l'aminae, latilaminae, astrorhizae, and other morphological features of stromato-poroids. The classification of stromatoporoids by Nicholson (1886-1892) is given, with some corrections in the distribution of genera by fami-

The Stromatoporoidea of the Soviet Union (Cont.)

stromatoporoids was confirmed. It was ascertained that the form and size of stromatoporoid pillars depend greatly on the environment in which the animal lived. Data is cited on the commensalism of the stromatoporoids. In particular, the camerate tubes of the coenosteum were studied in detail. In this particular case, the structure of the coenosteum had not been destroyed, a fact that points to the stability of the symbiosis—co-dwelling organisms fully adapted to one another. A symbiosis between Stromatoporoidea and Syringopora was most frequently observed. The stromatoporoids lived in an open sea, in shallow water near the shore line. They grew most abundantly in the environment of limestone facies. The age of series, within the time limits of a stage, may be determined by stromatoporoids. In rare cases the determination of formational units within a stage may be made. The paper contains 89 tables and a bibliography with 82 references.

Gases and Nonmetallic Inclusions in an Ingot Produced by Continuous Casting (Gazy i nemetallicheskiye vklyucheniya v slitke

nepreryvnoy razlivki)

V sb.: Nepreryvnaya razlivka stali. Moscow, AN SSSR, 1956, PERIODICAL:

pp 199-211

In comparison with ingots cast by the usual method, a steel ABSTRACT:

ingot produced by continuous casting exhibits a greater degree of chemical homogeneity, both longitudinally and in cross section. Thus, the variation in the content of C, S, and P at various points on the cross section seldom exceeds the margins of error permissible in a chemical analysis; the longitudinal variation in composition of metal is explained primarily by the reactions occurring in the ladle during the casting process, rather than by the liquation of the additives. In the process of continuous casting, gases and nonmetallic inclusions do not have enough time to float up and escape from the ingot; with the increased rate of crystallization they become fixed within the liquid metal

Card 1/2

TITLE:

Gases and Nonmetallic Inclusions in an Ingot Produced by Continuous Casting

at their former random positions within the liquid phase. Their total content may not be any greater than in a standard ingot, but they are more uniformly distributed over the cross section; this reduces the danger of possible defects attributable to the contamination of steel with gases and impurities. The author suggests that the smelting technology of steel intended for continuous casting may have to be altered in order to improve the quality of metal. It is essential that special measures be taken during the casting, in order to reduce the contamination of metal with nonmetallic inclusions and gases (employment of high-quality refractories, gas shielding, and an efficient design of the casting system).

rise in melting rate, which results in an increase in the depth of the molten pool with all the adverse consequences that this entails. To compensate for the rise in voltage, and a so for instantaneous fluctuations in power-system voltage, the transformer stages are periodically switched at the optimal time instant during the melting so as lo maintain a fairly constant power level. This is accomplished with the aid of an efficient corrent regulator. As a corollary, a basic requirement for an effective electroslag melting; stability of the electric regime, must be redefined. Now this stability does not mean a fixed level of such parameters as current intensity, voltages or electrode feeding rate, throughout the melting process. What is necessary rather is a continuous, flexible control of the variation in these parameters during the melting process. The ingots thus produced are of a more uniform quality. Department of Electrical and Eilitary Engineering. He wrote several books; "Alternating Currents," "The Theory of Alternating Currents," "Course in General Electrical Engineering," "Radio Engineering" and, together with his co-workers, problem books on "A Course in Alternating Currents" and "The Physical Principles of Electrical Engineering." He set up a number of special courses (military application of electric power, military portable electric power stations, electric equipment for armies, electrification of military engineering works, etc.) and also participated in many engineering projects with the Soviet Army. He has written many textbooks, monegraphs and articles on the theoretical and applied divisions of military electrical engineering. These include "Electric Circuits" and "Fundamentals for the Design and Planning of Mobile Electric Stations." Many of N. N. Lutsenko's students are working in sections of the Soviet Army, in scientific institutes and in colleges, and in industry. These students are continuing the work of their teacher, the founder of Soviet military electrical engineering. He received his professorably in 1938 and his doctorate in 1949. He has received the Order of Lenin, three "Red Banners." the Order of the "Red Star" and many medals. Orig. art. has: I figure.
